Interface Design (UX/UI)

ARTICLE ONE

The Era of Flat Design is Not a Trend. It's Another Step Forward.

<https://medium.com/i-m-h-o/9a0b3bdfc8>

“Many would argue that this trend makes designing easier while I’d argue that it’s made our job ridiculously more challenging.”

- Minimalism can still contain all principals of design while maintaining simplicity
- Not just about looking simple or sparse
 - Also about removing elements until only the necessary ones are there

“I found myself caring less about button effects and a whole lot more about interaction.”

- More focus on the experience itself
- Anticipate how the users will interact with the site as a whole
- Subtle animations and transitions can help bring a website to life
- Don't overdo animations
 - Can easily become a distraction
 - Too many animations can hinder performance
- Browser support is still limited so plan for users who may not see the animations

“There’s going to be more pressure on designers to get not just the visuals right but to bring together everything perfectly to tell a whole story.”

- Designers are becoming responsible for how something works as well as how it looks

“Skeuomorphic design was not a trend, it was necessary for technology to be adopted.”

- Users becoming more familiar with technology allows designers to advance how they think about interfaces

Sidebar Transitions

Transition effects for off-canvas views

Sidebar menus or off-canvas navigations can be revealed in many creative ways.

Here is some inspiration for showing them in style using CSS transitions.

ARTICLE TWO

Principles of User Interface Design

<http://bokardo.com/principles-of-user-interface-design/>

Clarity is job #1

- Users should be able to open your website or app and quickly understand how to navigate it (*UX/UI*)
- Introducing new gestures or navigation can take them longer to figure out the new experience (*UX*)
 - Users inherently want to explore how to use something, a clear interface makes that easier (*UI*)
- Don't be afraid to simplify screens like the homepage to make your intentions clearer (*UX*)
 - For multi-page sites, the homepage's main function is to get users to the next page (*UX*)
 - Clear and easily accessible links help users get to those other pages faster (*UX/UI*)

Test

Interfaces exist to enable interaction

- The simplest interface helps users to navigate through an experience
- A great interface inspires and excites them to explore an experience

Provide a natural next step

- Think about where your user might go next
 - *Example:* If they are on a project page, make it easy for them to advance to the next project without returning to the homepage.

A crucial moment: the zero state

- The first experience with your site will determine if people continue to explore
- Clear navigation and inviting visuals will entice users to dive deeper into your website

Great design is invisible

- Most casual users don't know what good design means, but good design will keep those users happy and engaged
- Larger companies, brands and startups are beginning to appreciate the value of good design
 - Google, foursquare, Facebook, Target, Twitter, etc.

“As in most design disciplines, interface design is successful when people are using what you've designed. Like a beautiful chair that is uncomfortable to sit in, design has failed when people choose not to use it.”

ARTICLE THREE

The Process: Designing websites that actually accomplish stuff.

<https://medium.com/web-design/b6db6dd508d4>

Sketches

- These sketches do not and should not be very neat
- Make sure to document things such as behavior and interactions to reference later

Wireframes & Mockups

- Narrow your sketches down to your favorite one or two and begin creating high fidelity wireframes
 - Ideas from different sketches can be combined in this stage
- These wireframes then allow you to move into the mockup stage

ARTICLE FOUR

Sketching For Better Mobile Experiences

<http://uxdesign.smashingmagazine.com/2013/06/24/sketching-for-better-mobile-experiences/>

“By sketching different solutions to a problem, we can explore them without immediately committing to one of them.”

- Much faster to grab a pen and paper than opening a program and creating a document
- You can immediately get ideas onto paper
 - Focus is on structure first and design later
- Much easier to convince yourself to start from scratch
- You get your idea saved so you can begin to think of alternative solutions
- Sharing your ideas with someone else is much quicker and collaborative
- Don't be afraid of sharing bad sketches
